Hi guys,

i'm working on a monitoring solution for my hardware nodes.

Hosts A with Debian Squeeze and linux-image-2.6.32-5-openvz-amd64 from the Debian Repository and Hosts B Debian Squeeze with Proxmox 2.6.32-12-pve from the Proxmoxrepo.

Both working with ovz Containers. When i'm trying to check netstat on Hosts A i see the Connections from the Hardware node, such as ntp. Hosts B (Proxmox) tells me the whole Connection tree including every VM connection. That result is bad for my checks and i don't wanna write separate checks for A & B.

Any ideas ?
