## Subject: route ipv6 while gateway is on a different subnet.
Posted by monkeynoob on Sat, 23 Jun 2012 13:25:12 GMT

Hi,

I am new here so apologize if this question was asked before.

I am pretty new to linux and learning it for my college project. So please bear with me.

I have been playing with my test linux box ( shipped to a colo facilities) , and.I have virtualized it for testin purpose, cause ovz is pretty fast when it comes to os reload.

So here is my situation, Recently I was able to get a /64 ipv6 block from the dc and they route that using a smal /126 block

So my main gateway is on a.different subnet.

So how do I configure my node so the vms would.be able to use ipv6 from /64 block.

Node.running centos 6 64 bit.( new install, haven't virtualize yet).

Thanks for any help in advance
