Basic usage example, ie. you have 3 public IPs from the same subnet available to your server:

- assign 1st IP to eth0 as you normally would
- do **not** assign 2nd and 3rd IP to eth0
- assign 2nd IP to one VM, using vzctl
- assign 3rd IP to another VM, using vzctl.

If you're in doubts which DNS etc. to use for your VMs, use same as you do for eth0.

That's it. Nothing else to do.
