hi as well

can you please be much more detailed in your report.

include kernel version and the linux-distribution you use on your host as well as your vpsid.conf file. also explain how you've created your ubuntu-12.04 container and what error message you get when "vzctl enter" fails. also pastebin an strace of the "vzctl enter" process.

when did you download the ubuntu-12.04 template? until recently there where bugs with the creation of some /dev/ files.

greetings,
joe
