---

Hello together,

today i played a little bit around with veth-interfaces.  
I'm using Debian Squeeze and openvz from the repos.  
vzctl version 3.0.24-12  
kernel 2.6.32-5-openvz-amd64

So i had installed bridge-utils and created a new bridge via `brctl addbr vzbr0`.

Then i created a new VE via `vzctl create <veid> --ostemplate debian_amd64_xxxx`

and added a new interface `vzctl set <veid> eth0,,,vzbr0`

after this i added the new veth<veid>.0 to vzbr0  
`brctl addif vzbr0 veth<veid>.0`

`brctl show` now shows me the new veth in the vzbr0. Fine...

BUT, when i restart the VE via `vzctl restart <veid>`, `brctl show` doesnt show the veth... seems like its lost.

Could you help me? =)
