Hello all

My situation I could not solve is the following.

I have three network cards in my server with openvz centos

eth0 - LAN x.x.x.x

eth1 - WAN x.x.x.x

eth2 - x.x.x.x WAN

internally in my virtualized I have 4 servers

server 1

2 web server

3 web server

dns server 4

I want to do is the following

connect eth0 to the LAN.

eth1 allow 2 hits the web server as a web server.

eth 2 let server 3 hits the internet as a web server and DNS

When the tarjetas configuraro there is any conflict that nothing works well.

I should do to make things work as I wish.
