---

My problem with pinging ip addresses from inside a vps was resolved successfully here. Now I have added another vps and am getting the same error again, although the prior solutions are added.

I had 3 vps running fine.

I added a 4. vps.

I enter the new vps.

I do ping google.com or ping ip and it doesn't work

I enter the other 3 vps and pinging works

pinging to the new vps from outside works

/etc/resolv.conf is the same as the other 3 working vps

vps.conf is the same as the others, except the ip address

The first 3 vps were created with vps.basic conf. After this I ran `vzsplit -n 10 -f vps.mytest` as told in the manual and applied this new configuration to all 4 vps with the command `/usr/sbin/vzctl set 195 --conf vps.mytest --save`

What did I forget here?
