You didn't say which version of Proxmox, but anyway, what you're looking for is 'man vzctl'. It's all there.

If you have a recent enough version of openvz kernel, the setting is as simple as you'd like it to be - just set '--ram' and '--swap' for the container.

How this will affect Proxmox frontend is beyond me... My guess is that you'll have different settings visible in your control panel than set for your VMs in reality.
