Subject: Building a custom container
Posted by Brad Alexander on Sat, 11 Aug 2012 15:41:05 GMT

Hi,

I know this is a pretty basic question, but could someone point me in the right direction to set up a custom container? I want to set up OSSIM 4.0 as a virtual machine. As there are no OpenVZ VMs available that I know of, I would like to set one up. I'm running Proxmox VE 2.0, but my hardware, while 64 bit, does not have the virtualization extensions to allow me to run KVM, so I would like to set up an OpenVZ container to run it. Would the best approach be to build it on something like VirtualBox then convert it, or is there a more straightforward way to go directly from the OSSIM iso image to a container?

Thanks,
