Subject: Running windows over OpenVZ Posted by sdkie on Thu, 16 Aug 2012 14:54:40 GMT View Forum Message <> Reply to Message

We where reading about OpenVZ and we came across one disadvantage that we cant run Windows OS on this virtualization platform.

Proposing idea:

We can run QEMU in one of the container which will create a virtualization environment for Windows.

Proposal:

We need to integrate the QEMU inside the OpenVZ so that whenever any windows OS need a virtualization environment, we will run a copy of QEMU working with single Windows OS.

Please give your suggestions over this.
