Quote:Is it correct, that veth0 is always 127.0.0.1 because there's always the lo interface which has 127.0.0.1.

This is just the default behaviour of "add_ip-script" (/etc/vz/dists/scripts/redhat-add_ip.sh for redhat templates).

You can change it editing the decent file.

P.S.

Actually, this isn't veth device! This is venet device.

There is also veth device in OpenVZ. So I change the subject of your post, don't mind? =)
