Subject: private on NFS and group privilege problem
Posted by woima on Tue, 28 Aug 2012 19:59:45 GMT

When running containers on NFS share user permissions wont work as it shuld. Users sub groups dont have any effect when chechking permissions. Dont know is this nfs client or server issue?

On container there is file:
drwxrwx--- 2 clamav clamav 4096 2012-08-27 15:19 test

$ whoami
amavis
$ groups
amavis clamav
$ ls -la test
ls: cannot open directory test: Permission denied

(user amavis is having group clamav and shuld have permissions to test folder)

client:
10.10.10.10:/containers on /mnt/pve/nfs-server type nfs (rw,vers=3,hard,addr=10.10.10.10)

nfs-server:
Linux nfs-server 3.2.0-23-generic #36-Ubuntu
/containers 10.10.0.0/16(rw,no_subtree_check,sync,no_root_squash)

EDIT: Problem occurs on host too when using NFS mount in it. So its not openvz bug. Rather, it is a bug in nfs or wrong mount options?
