Hi again,

Unfortunately, the solution with netdev_add is not perfect. Once I add a network interface to a Virtual Machine, its speed is capped at 100-120 kb/s. I cannot find why this limitation occurs. If the very same interface is used on the host machine, the transfer speed does not seem to be limited. Is there any known issues with netdev_add?

In regard to the Veth, none of my attempts to configure it were successful.

The real IP addresses are assigned by DHCP according to the Mac address of the respective interface.
