Hi again,

just a small follow up on this:

Inside the the container I'm able to change the barrier mount option with:

"mount -o remount,barrier=0 /" or "mount -o remount,barrier=1 /"

But changing other options like "noatime" (mount -o remount,noatime /) fails with "mount: permission denied".

Now I wonder if this is intended or a bug? Why allow changing barrier and deny noatime option?

BTW: I still haven't found a way to specify mount options in the container's config :(

Corin
