The system's still working heavily but the image is already reduced by around 60 GB so it seems to work well. :)

Would you suggest putting some script into crontab to compact all ploop images ex. once a week? Or probably do something like `ctid%7` and compact a few of them every night?

BTW: the man of `vzctl` contains the "compact" command. But the usage output of `vzctl` doesn't. Shall I file a bug report for it?

BTW 2: I just read about the ploop ballooning technique in the wiki. Am I correct in that it works quite similar to `sdelete` on windows (<http://pastie.org/4710364> or <http://technet.microsoft.com/en-us/sysinternals/bb897443.asp> x)?

Thanks!
