First, thanks a lot for answering so readily. Second, sorry my bad English.

Yea, I want to migrate a VE from one hardware node to another.

But it would like to make this in automatic way. I would like to use some load balancer to distribute the VEs for mine we in my farm, thus to distribute better the load for them.

It assumes this scene: I have 30 VEs in three machines. Of these the 30 three first ones are running applications that they demand much cpu or memory. I would like, then, to use some load balancer so that these three first ones were distributed in the three machines, without I to have to make manually this.

Thanks a lot any help.

Eduardo
