so, i follow instructions on openvz wiki

then i create this bash script:

CTID=102

```
cat << EOF > /etc/vz/conf/${CTID}.mount
#!/bin/bash
. /etc/vz/vz.conf
. ${VE_CONFFILE}
SRC=/mnt/home
DST=/mnt/disk
if [ ! -e ${VE_ROOT}${DST} ]; then mkdir -p ${VE_ROOT}${DST}; fi
mount -n -t simfs ${SRC} ${VE_ROOT}${DST} -o ${SRC}
EOF
```

chmod +x /etc/vz/conf/\${CTID}.mount

but after executing the script, i found my 102.mount like this

```
[root@dhcppc2 bash]# cat /etc/vz/conf/102.mount
#!/bin/bash
. /etc/vz/vz.conf

SRC=/mnt/disk
DST=/mnt/disk
if [ ! -e ]; then mkdir -p ; fi
mount -n -t simfs -o
```

my \${VE_CONFFILE} variable in the script return null on my 102.mount file, and now my container #102 failed to start.

really need your help
