Ever find a solution to this problem?

I am having a similar issue when live migrating wheezy containers.

I use Proxmox running the latest version in pvetest, also happens on latest Proxmox release.

Host kernel in pvetest is based on vzkernel-2.6.32-042stab061.9.src.rpm

vzctl: 4.0-1pve2

One easy way I found to reproduce a problem is to ssh into the container, then do "sudo bash"

After the live migration I get an error:

sudo: unexpected child termination condition: 0
