
Subject: [PATCH v5 04/14] kmem accounting basic infrastructure

Posted by [Glauber Costa](#) on Tue, 16 Oct 2012 10:16:41 GMT

[View Forum Message](#) <> [Reply to Message](#)

This patch adds the basic infrastructure for the accounting of kernel memory. To control that, the following files are created:

- * memory.kmem.usage_in_bytes
- * memory.kmem.limit_in_bytes
- * memory.kmem.failcnt
- * memory.kmem.max_usage_in_bytes

They have the same meaning of their user memory counterparts. They reflect the state of the "kmem" res_counter.

Per cgroup kmem memory accounting is not enabled until a limit is set for the group. Once the limit is set the accounting cannot be disabled for that group. This means that after the patch is applied, no behavioral changes exists for whoever is still using memcg to control their memory usage, until memory.kmem.limit_in_bytes is set for the first time.

We always account to both user and kernel resource_counters. This effectively means that an independent kernel limit is in place when the limit is set to a lower value than the user memory. A equal or higher value means that the user limit will always hit first, meaning that kmem is effectively unlimited.

People who want to track kernel memory but not limit it, can set this limit to a very high number (like RESOURCE_MAX - 1page - that no one will ever hit, or equal to the user memory)

[v4: make kmem files part of the main array;
 do not allow limit to be set for non-empty cgroups]
[v5: cosmetic changes]
