Hello,

we try to use ARP-Watch and similar tools in a VPS, but currently it doesn't work.

Is there any possibility to grant those tools fully access to an interface?

I've read about moving the interface into the VPS, but then you'll lose direct access from host...

Our host system is a CentOS with Kernel 2.6.16-026test015.2-smp  
the guest systems are CentOS or Debian.

Hope you could help us, thanks TSchilli
