Hello,

I was trying to install a little program named lufs wich needs the kernel headers but in the make part of installation it complains that it cannot find some files wich are declared in others.

After some googling the results pointed me to openvz community and so i started this thread to (maybe) find out what is going on...

Here's the output of the make command of that program.

Quote:

```
make[3]: Leaving directory `/root/lufs-0.9.7/kernel/Linux'
make[3]: Entering directory `/root/lufs-0.9.7/kernel/Linux'
Making all in 2.6
make[4]: Entering directory `/root/lufs-0.9.7/kernel/Linux/2.6'
make -C /lib/modules/`uname -r`/build SUBDIRS=`pwd` modules
make[5]: Entering directory `/usr/src/kernels/2.6.16-1.2111_FC5.026test012-smp-i686'

```

There are some parts of the kernel intentionally left out ?

Because i really need that program that enables me to mount ssh shares and send logs of the vps's to an external location.
