I am not a Plesk expert either (or even user), but the general idea is: you can have a special VE (let's call it "service VE", or just SVE) to do all management tasks. In other words, SVE hosts all the management tools.

If those tasks involve things like starting/stopping VE, setting VE parameters, or some other things involving the whole hardware node, it may be done via ssh channel from the SVE to the host system. That way it's a bit more secure than hosting all the management tools on a hardware node.
