I just modified /etc/init.d/vz to switch off suspending for a database container.

In the stop\_ves() function, in the inner most loop

for stage in \$stages; do

  for i in 0 1 2; do

    for veid in \$velist; do

added

if [ "\$stage" = "suspend" -a "\$veid" == "908" ]; then

  echo "Database container \$veid will be just stopped"

  continue

fi

So now CTID 908 doesn't get suspended - just stopped.
