It may be a question of ARP cache on the gateway.

If you have try to access the Net with the same IP address (VE), for example when testing the availability of IP addresses, the gateway may have associate this IP address(VE) with another MAC address, the one you are using when doing testing. That way, the gateway may have learn this IP-to-MAC and cache it for a certain period.

On a Cisco router, the ARP cache, retains info during 4 hours.

It's just a possibility.

Ben
