---

I am having strange issue.

The HN is a updated Centos 5.9 with 20+ VEs running without any issues for years. Recently I have add an VE from template centos-6-x86-devel and the only issue I am experiencing that the container is losing network/interface.

It has no pattern, like every 4 hours. When it does happen : the ifconfig command is stuck showing only lo, no ping of any host is available and venet0, venet0:0 are not showing nor responding.

restarting network service also gets stuck

I attempted to follow this post:

[forum.proxmox.com/threads/8301-OpenVZ-Containers-lose-internet-connection-%28VLAN-venet%29](http://forum.proxmox.com/threads/8301-OpenVZ-Containers-lose-internet-connection-%28VLAN-venet%29)

but it did not help.

Some times the network will drop for only few seconds, and sometimes permanently. The logs do not show anything on VE nor on HN.
