Try set greater verbosity of output with:
vzctl --verbose --verbose --verbose start 7777

If you use kernel RHEL6 042stab048.1 and up and vzctl utility 3.0.31 and up, you can try use container console to show, what container OS is doing during boot process.

On one terminal attach console to container

```
vzctl console 7777
```

And in other terminal run this container

```
vzctl start 7777
```

Have you some container, which started successfully on this HN?

Where did you get container template, which you try to start? It may be misconfigured or corrupt in any way.
