Hi,

Is there a guide somewhere that discusses performance tuning for OpenVZ?

I am running CentOS 6.4 on a Dell PowerEdge server with 1.3TB disk space in a RAID 10
configuration with 32GB of memory.

I run ISPConfig 3 3.0.5.2 which has five containers:
mail.example.com - mail server
   7GB RAM and 3GB VSwap

rock.example.com - web server 1
   7GB RAM and 3GB VSwap

pb.example.com - web server 2
   4GB RAM and 2GB VSwap

ns1.example.com - name server 1
   1GB RAM and 512MB VSwap

ns2.example.com - name server 2
   1GB RAM and 512MB VSwap

In some of the reading I did, I thought I wouldn't have to tweak beancounter parameters if I used
RAM and VSwap settings. Did I misunderstand my reading?

Each container is running Debian Squeeze.

I have successfully installed the system, and have made some adjustments of kmemsize and
privvmpages so all software could be installed. My mail server seems to take the most resources.

My goal is to do my best to have these parameters set well before the servers starts getting
loaded, and then fine tuning parameters as needed.

Are there any guides to help me do this?

Here is the /proc/user_beancounters for the mail server.

Version: 2.5

uid	resource	held	maxheld	barrier	limit	failcnt

If there is anyone who can help provide guidance, I would really appreciate it.

Thank you,
Darin
