UPDATE to this problem:

1) IPv6 inside container starting to work if execute ping6 to the real gateway/router address (not fe80::1). After that IPv6 inside container in which ping to real gateway/router IPv6 address executed started to work!

2) Maybe this error is also related to our problem.

Executing this command in node with IPv6 problem we receiving error:

```
root@server ~]# ip -6 neigh  
fe80::1 dev eth0 router FAILED
```

If we execute this command in the node where IPv6 is working normally there is no error:

```
[root@server ~]# ip -6 neigh  
fe80::1 dev eth0 lladdr 78:de:cc:34:fa:95 router STALE
```

Is anyone experienced this issues and know how to fix this permanently without ping to router execution?

Thank you for any help.
