1. there is no possibility in DNS to tell which port to use.
dns name just tells which host to access.
port is what service to access on that host, as example 80/tcp port typically means http service

2. please read my answers. I already told you what to do

3. you can always redirect connection to some port to CT with iptables. than you can access
needed service some_domain.com:some_port

4. if you don't understand how things works (dns, services and etc) please read manuals and
books. your problem is not related to openvz.
