Rollin,

I'm just curious if you already or plan to build this web GUI. I already started working on a similar project and if you have any plan to build one, probably we can work together to get this going faster ..

My project is still in the early stage of development but it will have the following features:

1. Run on it's own VE for security purposes.
2. No sudo, everything is currently run through SSH but I might consider using an xmlrpc or SOAP daemon similar to vzagent.
3. No MySQL, I'm using sqlite instead to keep things clean and less overhead.
4. It runs on its own httpd.
5. All communication between the GUI and HN are using XML. I'm trying to stay close to vzagent XML schema as possible.
6. It has the ability to run in single server mode or multiple server mode with a centralize management GUI which I have yet to start working on it.

I'll provide the screenshot, when I have it available.
