Kenny,

Certainly I do not want to duplicate some one else's work! Your design considerations are agreeable to me.

Last week I read a few posts on the SWsoft forum. There were discussions regarding the choice of XML-RPC vss. SOAP. One of the cited disadvantages of XML-RPC is the amount of data that needs to be passed on server/VE status--upwards of 12MB at a time--and the load XML-RPC then places on the system. The argument against SOAP is its relative complexity. At this point I have no opinion regarding which would be best to use. For my work, I could survive with considerably less server/VE status info at a time.

Perhaps I could help a little. My prefereces would be to write scripts in Perl or PHP, though C++ is also a possibility.

Regards,  
Rollin
