I'd vote against Python and PHP, at least for the backends/core parts (although I consider it OK for the interfaces). Either C/C++ or, if you want scripting language, please consider Python.

From my side, I could help with organizing a GIT or SVN repository, mailing list, bugzilla, hosting and all that stuff...and perhaps some programming and infrastructure (like using auto* tools, packaging into RPM, etc.), too. I do believe that putting the source code into a repository at the early stages helps a lot
