

Hi,

I have currently OpenVZ with Debian squeeze. As well known, OpenVZ is not included in wheezy any more

How "reliable" is [downloads.openvz.org/debian](http://downloads.openvz.org/debian)? Is it a reliable replacement for the original Debian packages in terms of:

- 1.) Is it an official part of the OpenVZ downloads or just put there as a convenience without warranty?
- 2.) Can I be sure that this repository will work at least until EOL of wheezy?
- 3.) Is the kernel always the SAME version and configuration as in wheezy but the OpenVZ patch applied?
- 4.) When Debian makes an update for the Kernel, will the update appear on [downloads.openvz.org](http://downloads.openvz.org) very soon later?
- 5.) My biggest concern: security. How does the OpenVZ repository deal with security problems in the kernel? Will it provide security fixes similarly fast as [security.debian.org](http://security.debian.org) does?

The server needs to run the whole year without much user interaction in a stable and reliable manner. Suddenly not having a current kernel (because OpenVZ repository decides to shut down) or a security hole (because the repository does not provide the fixes in "realtime") could be a potential problem in my setup.

Thank you
