

Hi,

I have currently OpenVZ with Debian squeeze. As well known, OpenVZ is not included in wheezy any more

How "reliable" is downloads.openvz.org/debian? Is it a reliable replacement for the original Debian packages in terms of:

- 1.) Is it an official part of the OpenVZ downloads or just put there as a convenience without warranty?
- 2.) Can I be sure that this repository will work at least until EOL of wheezy?
- 3.) Is the kernel always the SAME version and configuration as in wheezy but the OpenVZ patch applied?
- 4.) When Debian makes an update for the Kernel, will the update appear on downloads.openvz.org very soon later?
- 5.) My biggest concern: security. How does the OpenVZ repository deal with security problems in the kernel? Will it provide security fixes similarly fast as security.debian.org does?

The server needs to run the whole year without much user interaction in a stable and reliable manner. Suddenly not having a current kernel (because OpenVZ repository decides to shut down) or a security hole (because the repository does not provide the fixes in "realtime") could be a potential problem in my setup.

Thank you
