Hello,

This workaround is not "perfect" for me because it installs
"kernel-firmware-2.6.32-358.14.1.el6.noarch" and "kernel-2.6.32-358.14.1.el6.x86_64".

This means that, because of the "irqbalance" dependency, I have two sets of kernels (CentOS +
OpenVZ) instead of just one and it's messing with the list of kernels in Grub.

Is it possible to :

  * Prevent the "kernel" package to update the grub list?

  * Remove the "irqbalance" package? (this will remove kernel(-firmware) by dependency

  * Have an "irqbalance" package not dependent of the official kernel package we're not using?

Thanks,
