there is plenty activity in this forum

there is no way you can protect your files from CT provider.  
if you don't trust your provider- don't use it.

I would ask if encryption (safe) is possible with virtualization technologies (kvm,xen,vmware).  
given various scenarios how to gain control of virtual server while it is running and while your  
encrypted image is mounted

probably most safe solution for you would be use bare metal HW with encrypted partitions.

if you are afraid of local providers, then maybe use international provider?
