Well... if you've compiled this module in you can pass parameter to it using kernel parameters. For example, using GRUB config:

```
kernel /vmlinuz root=/dev/sda2 ip_conntrack_enable_ve0=1
```

Please, if possible, try this method and if it doesn't work report about it in bugzilla (bug #218).

Thank you very much!

vass

FIXED =0 -> =1. Badly missprint.
