As far as I understand you are using precreated template
(gentoo-20060317-i686-stage3.tar.gz).
I've tried them and it works for me, so there is no need
now to recreate template.
We must discover first what's the reason, why it doesn' work.
Ok. Please do the following:
200 - VEID of VE, where enter fails.

ls -l /vz/private/200/dev/ptyp0
ls -l /vz/private/200/dev/ttyp0
ls -l /vz/private/200/dev/ptmx

ls - l /vz/private/200/lib/udev/devices/ptyp0
ls - l /vz/private/200/lib/udev/devices/ttyp0
ls - l /vz/private/200/lib/udev/devices/ptmx

ls -l /dev/ptyp0
ls -l /dev/ttyp0
ls -l /dev/ptmx

100 - VEID of some other VE, where enter passes:
ls -l /vz/private/100/dev/ptyp0
ls -l /vz/private/100/dev/ttyp0
ls -l /vz/private/100/dev/ptmx

Post the results here, please.
Thanks.
