---

I have some CTs with big /home partitions.  
So I plan to re-organize and move those /homes from different CTs to 1 common NFS share.

I have 2 options:

1. to move just /home to NFS share within CT.
2. to move whole CT to NFS.

2st option easy to implement.

1st option harder to support (seems I'll have some permission issues).

I prefer 2st option - it's seems very easy to move whole CT to NFS and just connect that NFS share within HN.

But in this case all CT OS files will be loaded through NFS (while in case of 1st option CT OS files will be loaded from local drive).

Will 2nd option less efficient than 1st option by speed ?

Any ideas?

Thanks !
