www.virtualizor.com/wiki/Install

there is no information about openvz install, please follow:
http://wiki.openvz.org/Quick_installation

Actually, virtualizor is a control panel that supports OpenVZ, among other things. I'm not familiar with it, but their install probably takes care of OpenVZ installation along the way.

This does seem like a kernel problem after all. If the data center requires a modified kernel in order to run plain CentOS, then OpenVZ kernel will have the same problem as the plain CentOS kernel has.

Simply put: find out what modifications they make to CentOS kernel and do the same to OpenVZ one.

Keep in mind, you'll have to do this at every kernel upgrade.
