It seems something has changed my firewall/iptables settings as if i do:

```
service iptables stop
```

I'm able to ssh into it again!

I then used:

```
system-config-securitylevel
```

From there I realised that eth0 was not "trusted", so I enabled that and I can now ssh in again.

The question is now, how do I ENSURE this will not happen if I do it on a machine at a remote location, otherwise this will cost me to rectify.

Thanks.
