Well, I don't agree back but I no longer have a debian 6 HN to look at. For sure, netstat in HN shows all connections in a Centos 6 HN.

I thought the kernel in the HN can "see" every process in every VE. There's only one kernel running on the box.

Not sure why you think this is a problem. If you need to, you can work out which connections belong to which VE by looking up the PIDs with vzpid.
