---

Hi there,

Im in pretty much need of help.

I just installed a fresh Centos 6.5 and OpenVZ kernel on an IBM X3650 M4. After restart the boot stuck after

```
Tryiing to allocate 995 pages for VMLINUZ  
[Linux-EFI, setup=etcetc, size=etcetc]  
[Initrd, addr=etc etc, size=etcetc]
```

The kernel is the latest stab: 042stab084.12

I dont even know what info to provide. No panic, not any messages apart from this.

This was the first restart after installing openvz kernel.

UPDATE: then I realized it wont start neither with the stock kernel ./ I'll try to reinstall it tomorrow. Hope it'll turn out differently will feed back.

Any ideas?

I would really appretiate any help.

Thank you in advance!

Bests,  
Semirke
