Subject: Unable to fork: Cannot allocate memory but websites loading
Posted by postcd on Sat, 04 Jan 2014 09:17:25 GMT

How can i fix "Unable to fork: Cannot allocate memory" on a VPS? I cant SSH into it, only see this from VPS host server. But websites loading ok on that VPS..? How to debug the cause & fix please?

Beancounters software returns:
held.....4095.62 mb
maxheld..4201.57 mb
barrier..4096.00 mb
limit....4096.00 mb
failcnt..29850479

But i dont want to increase memory for this VPS, at same time i dont want VPS to return "Unable to fork: Cannot allocate memory".. what to do?
