You do have to provide a working nameserver. That 169.254 one isn't going to work.

Do updates work on the HN? Then have a look in its /etc/resolv.conf to find a working nameserver IP. Otherwise, ask your cable provider. If that resolv.conf you showed is on the HN, then 209.18.47.61 is a possibility.

Once you have a nameserver, change it like this on the HN. (Don't edit resolv.conf on the container, that's not permanent.)

HN# vzctl set 101 --nameserver MY.NAME.SERVER.IP --save
