Subject: Re: inodes limitations? Disk quota exceeded, but no where near it?

A really permanent fix would be to stop whatever is using all the inodes. Even if you get vz quota to stop complaining, eventually this will use all the inodes in the filesystem.

Look for something that is creating a lot of files and leaving them behind: session files, temporary files, etc. Either stop it doing this, or clean up by deleting old files.

Or for a cheap fix, set inode quota to a very large number.
