Hi guys, I'm new to OpenVZ and I really appreciate any help from you guys regarding my issue below:

Basically, I installed everything based on quick installation guide from OpenVz website.

And now, I'm stuck with the container creation. Here's the command that I used:
vzctl create 102 --ostemplate centos-6-x86_64.tar.gz

And the error return as:
vztmpl-dl ERROR: template centos-6-x86_64.tar.gz not found!
Cached OS template /vz/template/cache/centos-6-x86_64.tar.gz.tar[.gz|.bz2|.xz] not found
Destroying container private area: /vz/private/102
Creation of container private area failed

I have placed the template files (centos-6-x86_64.tar.gz) in the following path:
/vz/template/cache

Can someone point to me what went wrong with my setup?

Thanks in advance!
