Of course it's possible to run different OS templates on a single host. Try it...

As for implications - there are none, apart from usual ones that openvz itself brings.

I think it's easiest to learn about the differences between a regular hadware server and a virtualized container by reading the openvz's wiki, looking at the man pages of tools such as vzctl, looking at the various how-to's and articles posted on line, etc. Obviously, some differences exist or a container could not be separated from the host and other containers, but there are surprisingly few.

Like I mentioned, try it out. Openvz is simple to use and first hand experience is best in such cases.
