OpenVZ Debian-packages from debian.systs.org seem to be compiled so that they use /var/lib/vz as the vz-root instead of /vz -- AFAIK for better FHS-compliance.

The documentation is quite RH-specific, although the poll at <http://forum.openvz.org/index.php?t=msg&th=50> shows that Debian-based distributions are the preferred choice of OpenVZ-users. ;)

You can just do a symlink /vz pointing to /var/lib/vz if you want; however there is no reason why you should need it, just use /var/lib/vz whenever the documentation refers to /vz.

BR,

Mika
