---

I am trying to install the Openvz on a Dell R720,based on raid and LVM.

OS : CentOS 5.9 (vmlinuz-2.6.18-348.el5)  
OpenVZ: 2.6.18-194.3.1.el5.028stab069.6

First I installed the CentOS5.9 on the R720, it's running all right.  
Then I install the OpenVZ kernel and reboot the Server,  
kernel panic occurred ,the booting message shows that the  
LVM was not found...

I attached the console capture,  
and the /etc/modprobe.conf is as follows

```
-----  
/etc/modprobe.conf  
alias eth0 ixgbe  
alias eth1 ixgbe  
alias eth2 igb  
alias eth3 igb  
alias eth4 igb  
alias eth5 igb  
alias eth6 igb  
alias eth7 igb  
alias scsi_hostadapter megaraid_sas  
alias scsi_hostadapter1 ahci  
-----
```

so I had to chage back to the boot kernel (vmlinuz-2.6.18-348.el5).It booted .  
I also tried to change the megaraid\_sas.ko of the initrd-2.6.18-194.3.1.el5.028stab069.6.img, and  
rebooted again,  
still failed.
